

1. Let  $Z$  be a standard normal random variable.

(a) What is  $P(Z \leq 0.8)$ ?

R:  $\text{pnorm}(0.8, 0, 1) = 0.788$   
or:  $\text{pnorm}(0.8)$

(b) What number  $c$  is such that  $P(Z \leq c) = 0.4$ ?

R:  $\text{qnorm}(0.4) = -0.253$

2. Let  $X$  be a normal random variable with mean 24 and standard deviation 2.

(a) What is  $P(23 \leq X \leq 25)$ ?

R:  $\text{pnorm}(25, 24, 2) - \text{pnorm}(23, 24, 2) = 0.383$

(b) What number  $c$  is such that  $P(X \geq c) = 0.2$ ?

R:  $\text{qnorm}(0.8, 24, 2) = 25.68 = c$   
 $\uparrow 1-0.2$

3. What is the probability that a normal random variable is within 1.5 standard deviations of its mean?

$$P(\mu - 1.5\sigma < X < \mu + 1.5\sigma) = P(-1.5 < Z < 1.5) = 0.866$$

R:  $\text{pnorm}(1.5) - \text{pnorm}(-1.5)$

4. Suppose that a fair, 6-sided die is rolled 1000 times. Use a normal distribution to approximate the probability that the number 6 appears between 150 and 200 times (inclusive).

Let  $X \sim \text{Bin}(1000, \frac{1}{6})$  be the number of 6s rolled.

Then  $E(X) = \frac{1000}{6}$  and  $\sigma(X) = \sqrt{\frac{5000}{36}} \approx 11.785$ .

Then  $X$  is approximately  $Z \sim N\left(\frac{1000}{6}, 11.8\right)$ .

$$P(150 \leq X \leq 200) \approx P(150 \leq Z \leq 200) = 0.919$$

Binomial distribution gives 0.92645

Normal approximation to the binomial distribution is "good" when  $np \geq 10$  and  $n(1-p) \geq 10$

**CONTINUITY CORRECTION:**  $P(149.5 \leq Z \leq 200.5) = 0.925$

5. Let  $f(x)$  denote the standard normal pdf. Estimate  $f(1)$  using only the information in Table A.3 in the text.

Table A.3 gives  $\Phi(z) = \int_{-\infty}^z f(x) dx$ . That is,  $f(x) = \Phi'(x)$ .

Thus:

$$f(1) \approx \frac{1}{2} \left( \frac{\Phi(1.01) - \Phi(1)}{0.01} + \frac{\Phi(1) - \Phi(0.99)}{0.01} \right) = \frac{\Phi(1.01) - \Phi(0.99)}{0.02} = \frac{0.8438 - 0.8389}{0.02} = \frac{0.0049}{0.02} = 0.245$$

Compare with the value given by R:  $dnorm(1) = 0.24197$

6. Let  $f(x)$  denote the pdf of the  $N(\mu, \sigma)$  distribution. Show that the points of inflection lie at  $x = \mu \pm \sigma$ . (Hint: differentiate twice with respect to  $x$ .)

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$f'(x) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \frac{-(x-\mu)}{\sigma^2} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$f''(x) = \frac{-1}{\sigma^3\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} + \frac{(x-\mu)^2}{\sigma^5\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}} = \frac{(x-\mu)^2 - \sigma^2}{\sigma^5\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$f''(x) = 0 \Rightarrow \frac{1}{\sigma^3\sqrt{2\pi}} = \frac{(x-\mu)^2}{\sigma^5\sqrt{2\pi}} \Rightarrow \sigma^2 = (x-\mu)^2 \Rightarrow x - \mu = \pm\sigma \Rightarrow x = \mu \pm \sigma$$

Furthermore:
