

# SIEVE OF SUNDARAM

If  $q$  is an odd composite, then  $q = (2i+1)(2j+1)$   
for some positive integers  $i$  and  $j$ .

Then:  $q = 4ij + 2i + 2j + 1 = \underline{2(2ij + i + j)} + 1$

If  $p$  is an odd prime, then  $p = 2w + 1$ ,  
but  $w \neq 2ij + i + j$  for any integers  $i$  and  $j$ .

## ALGORITHM:

1. Start with a list  $1, 2, 3, 4, \dots, m$
2. Remove all numbers of the form  $2ij + i + j$
3. For all remaining numbers, double and add 1.

## EXAMPLE:

$$\text{nums} = \underline{1}, \underline{2}, \underline{3}, \cancel{4}, \underline{5}, \underline{6}, \cancel{7}, \underline{8}, \underline{9}, \cancel{10}, \underline{11}, \cancel{12}, \cancel{13}, \underline{14}, \underline{15}$$

$$\begin{array}{l} i=1, j=1: 2ij+i+j = 2(1)(1)+1+1 = 4 \\ i=1, j=2: 2(1)(2)+1+2 = 7 \\ i=1, j=3: 2(1)(3)+1+3 = 10 \\ i=1, j=4: \quad \quad \quad = 13 \\ i=1, j=5: \quad \quad \quad = 16 \end{array} \left. \vphantom{\begin{array}{l} i=1, j=1 \\ i=1, j=2 \\ i=1, j=3 \\ i=1, j=4 \\ i=1, j=5 \end{array}} \right\} \begin{array}{l} i=2, j=2: 2(2)(2)+2+2 = 12 \\ i=2, j=3: 2(2)(3)+2+3 = 17 \\ \hline i=3, j=3: 2(3)(3)+3+3 = 24 \end{array}$$

Double and add 1:

$$3, 5, 7, 11, 13, 17, 19, 23, 29, 31 \leftarrow \text{primes!}$$

---

## PRIME COUNTING FUNCTION

$\pi(x)$  is the number of primes less than or equal to  $x$

Example:  $\pi(10) = 4$

Since 2, 3, 5, 7 are the primes  $\leq 10$
